

Bark Topping Machine

The G100 Pot topper is a fast and accurate filling system for the topping and settling pots from 1ltr to 10ltr.

The main unique feature of this machine are that the bark is distributed across the pot and then 'vibrated' in to give a settled and perfectly level finish. This of course reduces the chance of losing the bark topping when the pot is transported around the nursery and that there are very few adjustments to make when changing pot sizes.

The machine is available with several hopper sizes and configurations, and the input direction can be handed either way to suit your potting shed layout.

The machine features variable speed control throughout and has a speed controllable floor belt also. The G100 is very easy to use and hassle free.
